

JONATHAN HINDI

UI/UX DESIGNER

IT ALL STARTED WHEN OPPORTUNITY CAME KNOCKING

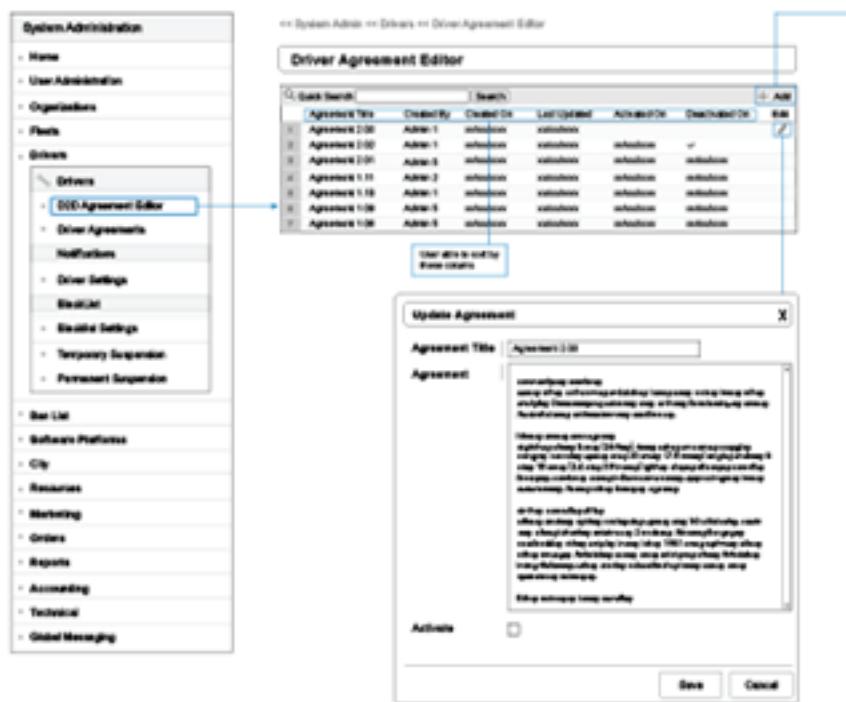

cabulous!

Cabulous is a startup company which provides an automated system that mediates between cab drivers/fleets and their passengers. It also provided a dispatch system and tracker for dispatchers and fleet owners. In this unique dynamics of integration, I was able to bring forth a dispatch system that was easier, faster and more comprehensive than what the cab industry currently used. I was also able to bring forth a user friendly app that allowed users to select rides directly and easily without needing to do anything more than to tap on a cab on their map. My responsibilities included:

- Product development
- Designing logic workflows
- Designing native UX wireframes
- Designing responsive platforms that embraced native tools
- Front end development
- QA and Support

cabulous!

Flywheel is a company that provides a geo-tracking software solutions that can be implemented on any smartphone. This challenging opportunity pushed me to fully embrace native UX. We were creating three main platforms web, native Android and iOS. Keeping in mind that the product was still being developed and refined, my responsibilities were:

- Converting simple logic work flows to full UX wireframes for web, Android & iOS
- Product development
- Front end development
- Designing assets for both Android & iOS plus extraction & optimization
- Android XML layout development

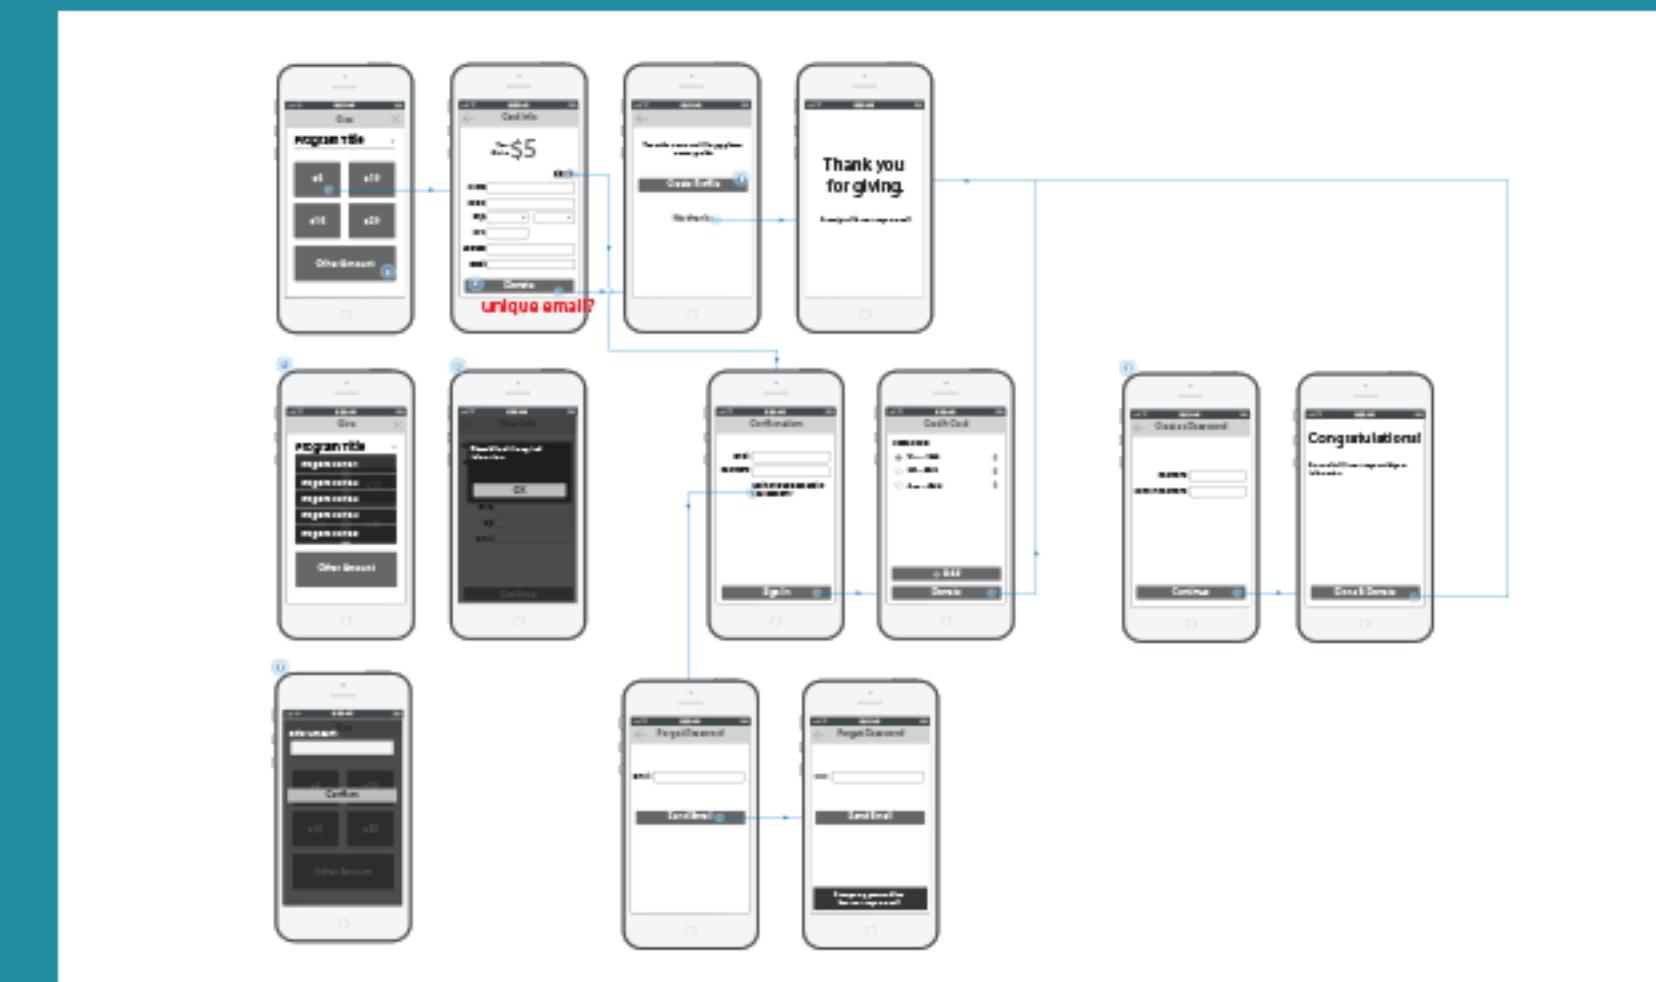

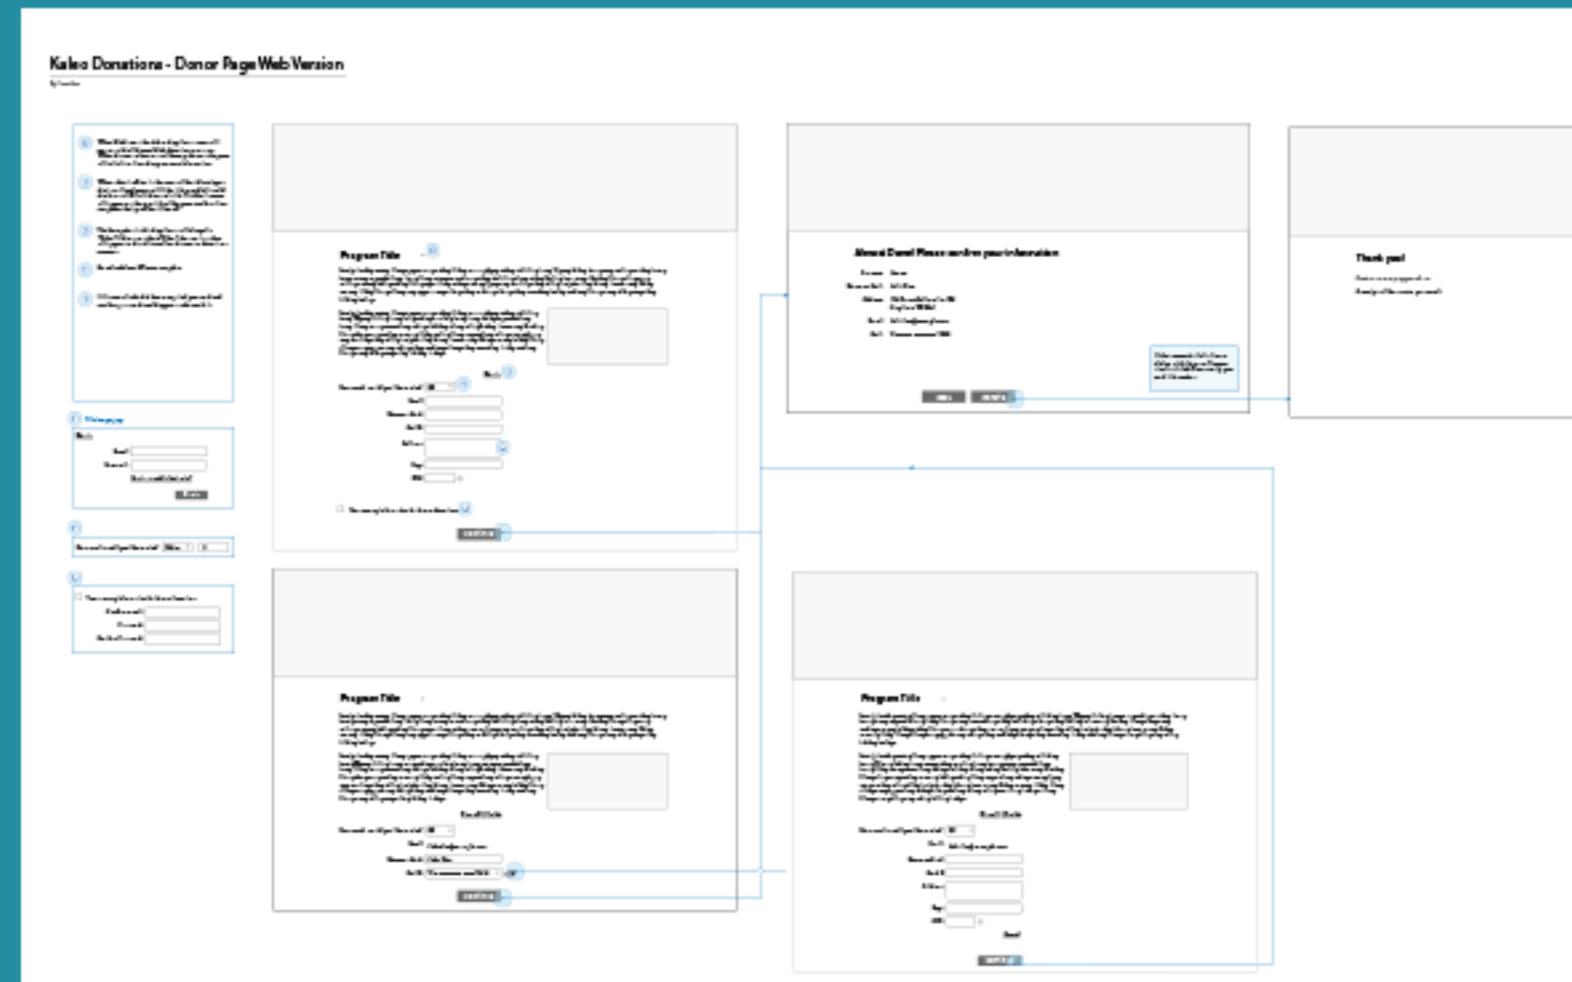

KaleoApps is a startup company which targets non-profit organizations. They provide a digital donation platform and developed mobile applications. Working with a third party vendor and branching out to allow white labeling was a very interesting task to take on. In this position I learned how to accommodate multiple demands coming from multiple businesses and keep up with a UX that is flexible and agnostic enough to allow any user with any information to create a full and beautiful product. My responsibilities included:

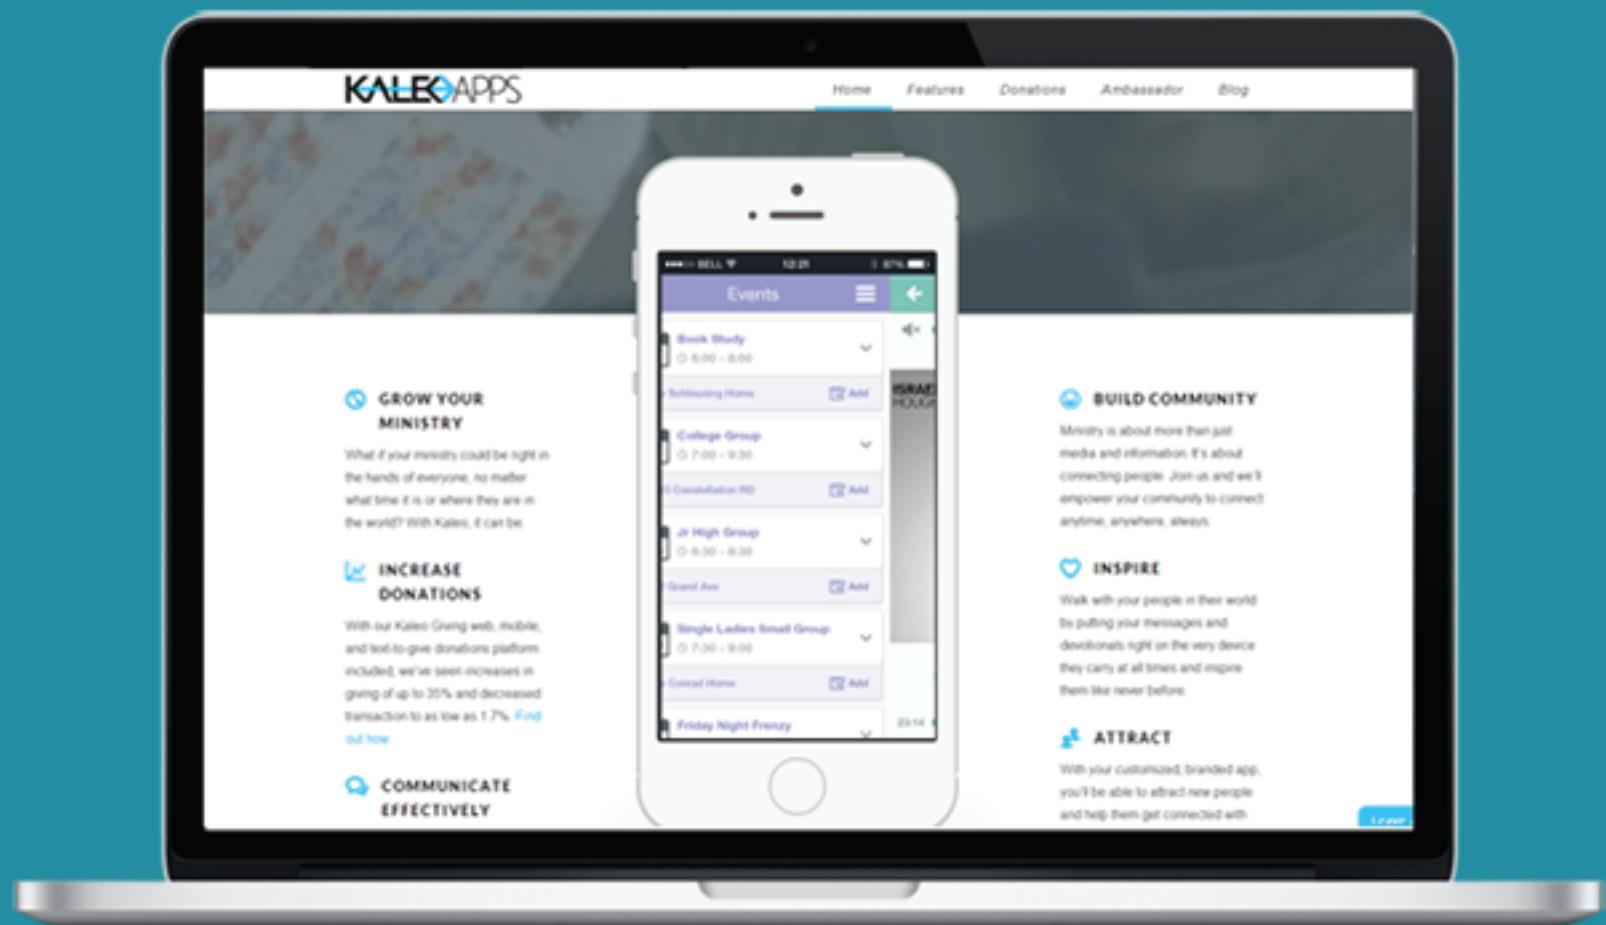

- Maintaining business relationships and goals
- Designed logic work flow and UX wireframes
- Product development
- Designing responsive web and mobile interfaces
- Front end development

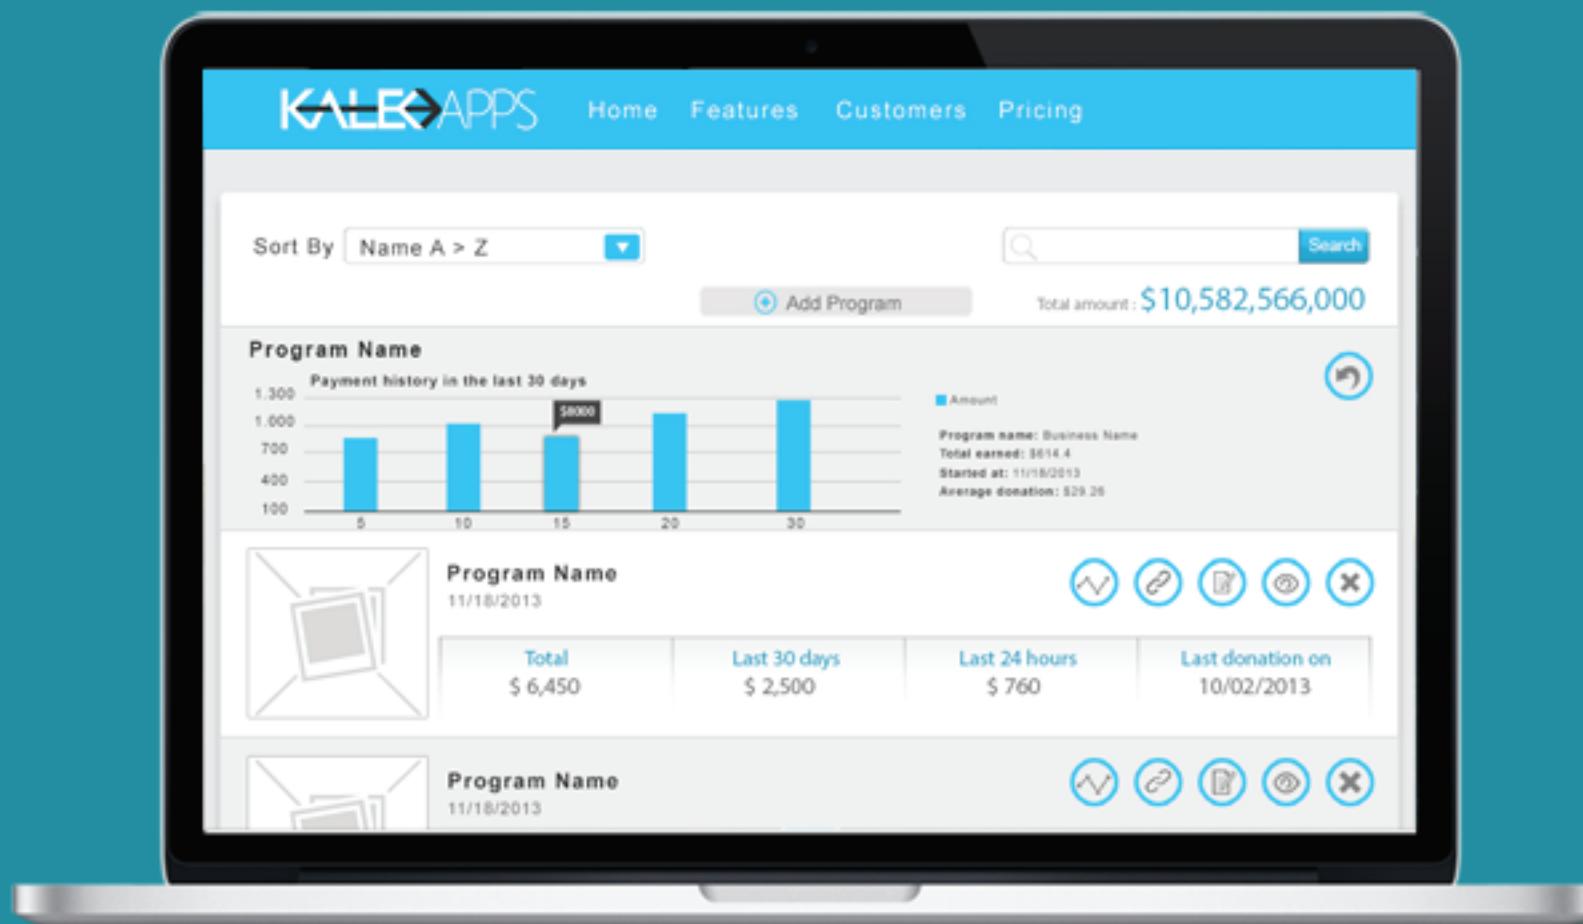

KALEO APPS

KALEE APPS

BuildFire is a startup company that provides a CMS for phone applications which work on both Android and iOS using PhoneGap technology. This is a particularly interesting position. With three different types of users, I have to integrate all platforms and services to all levels of clients and maintain the flow of information with the proper permissions. My responsibilities are:

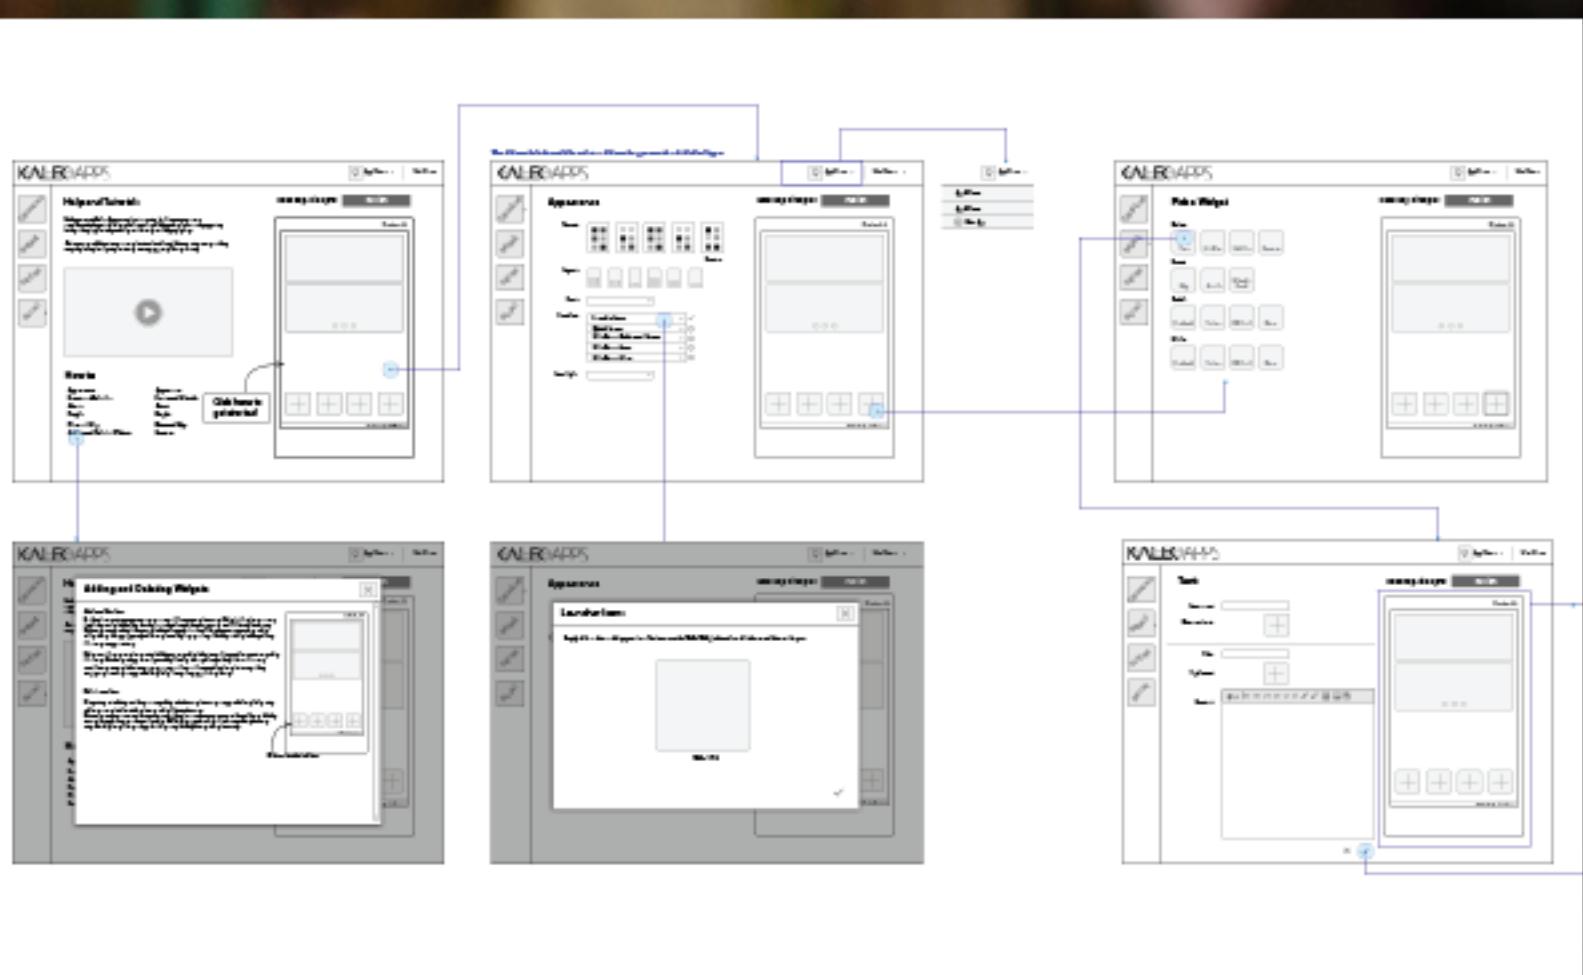

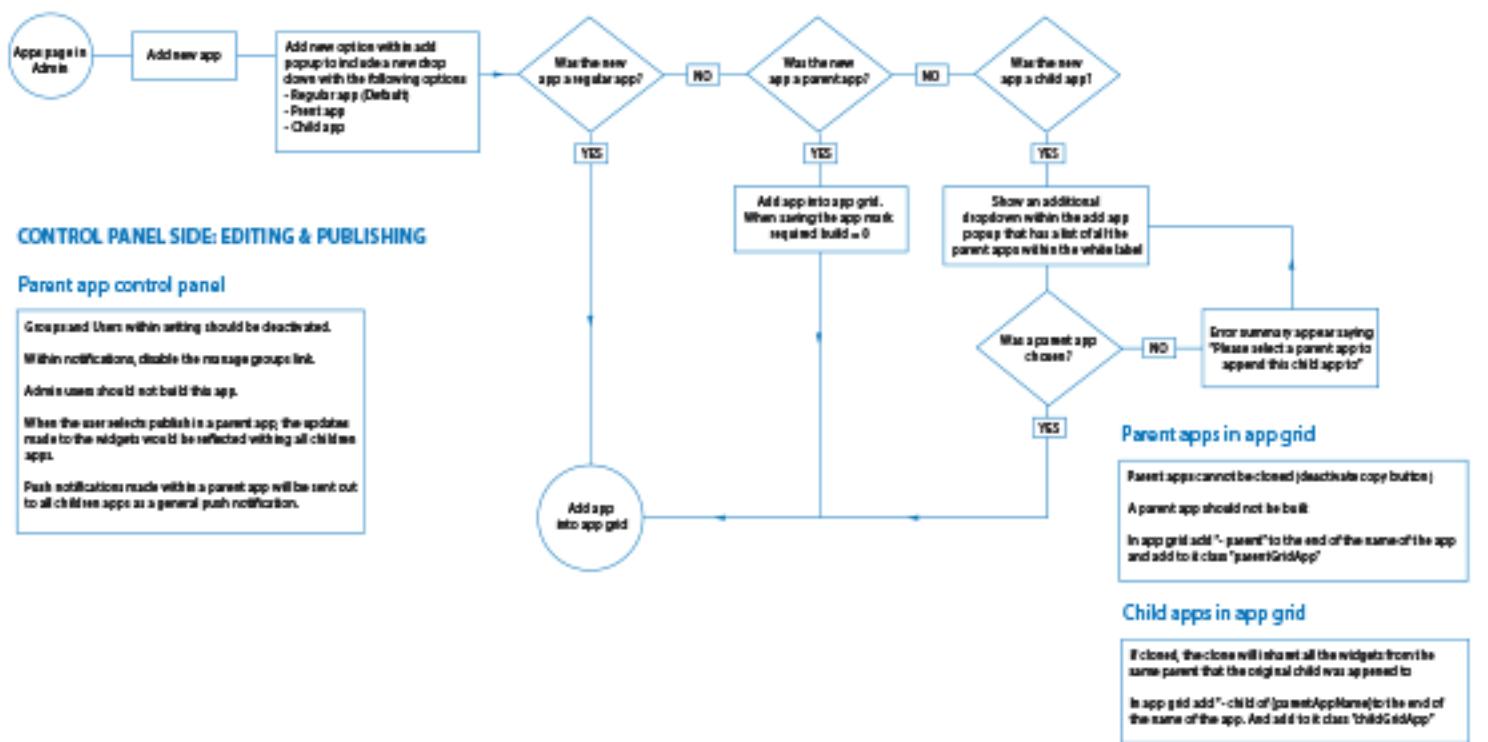

- Communicating with product and development teams
- Draw out the transfer of information from one platform to
- Help develop the products and features
- Drawing out logic flow charts
- Design UX wireframes

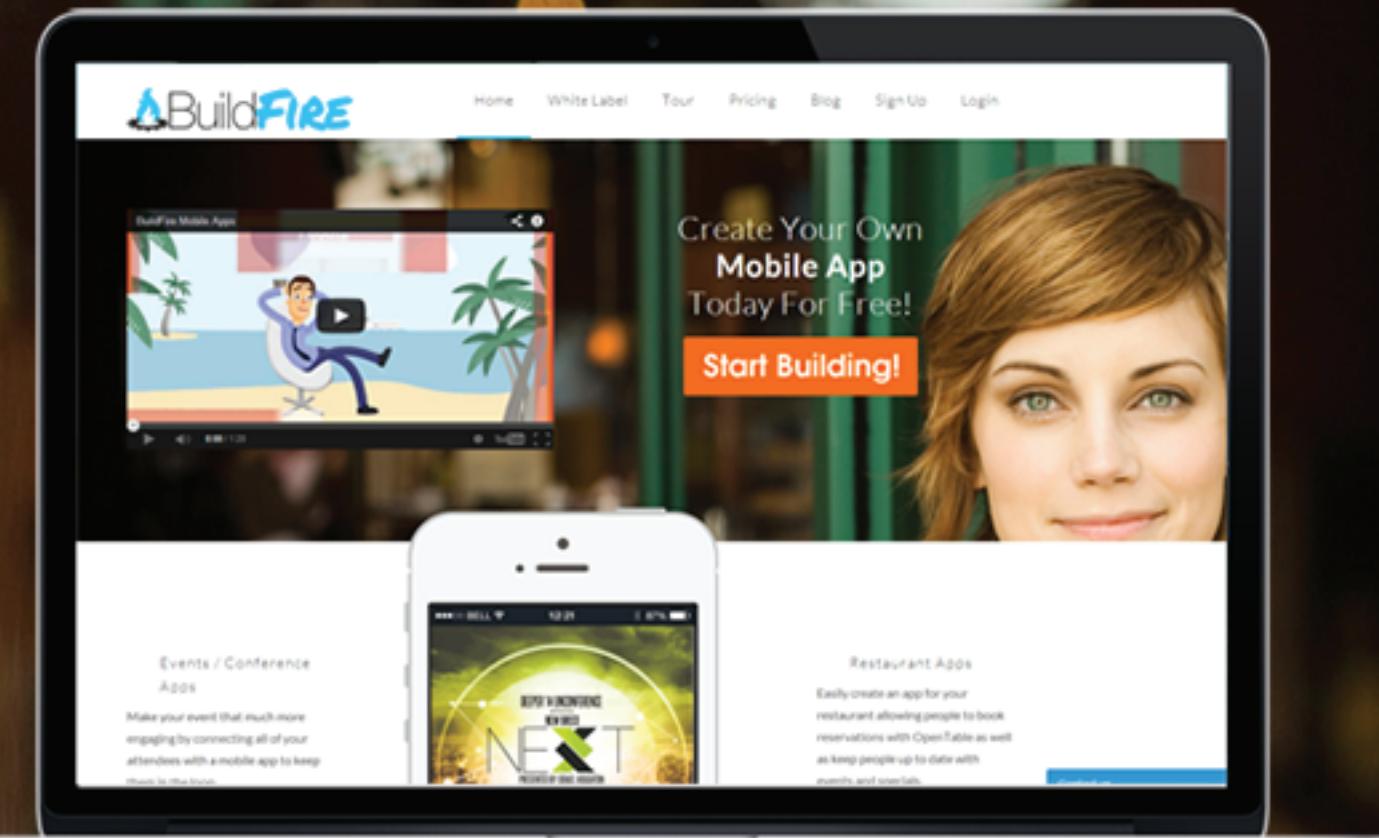

BuildFire Parent & Child Apps

by Jonathan Hind

ADMIN SIDE: CREATING AN APP UNDER

A screenshot of the BuildFIRE mobile app builder interface on a tablet. It shows a sidebar with options like Home, Appearance, Widgets, Artwork and Branding, Colors and Themes, and Advanced. The main area displays a preview of a mobile screen with a lock icon and the text "14:56:00".

Two screenshots of the BuildFIRE dashboard. The left one shows a preview of a mobile app screen with a lock icon and the text "14:56:00". The right one shows a table of apps with columns for Name, Plan, Bundle ID, Published, Active, Assigned, iOS, Android, Open, Close, and Edit. The table lists various apps such as "App - 1", "App - 2", "Medan", "Prod Test", "Rant", "Danny's Test", "Rants Test", and "Rants's Test".
